

## REAL-TIME FUSION

Scale and merge (low res + high res)

Combine data (base + detail)

Adjust and augment (corrections)

## VISUALIZATION

Consumer level hardware (CPU, GPU)

Real-time, interactive 3D

Seamless geometry + textures

## ANALYSIS

Visibility determination (e.g. culling)

Collision detection (e.g. physics)

Obstacle avoidance (e.g. SDF)

Path finding / navigation

## HIGH-PRECISION

Ground Sample Distance

- ▶ 500 m : global data
- ▶ 50 cm : local data
- ▶ 0.25 mm : surface scans

Digital Elevation Model (DSM, DTM)

- ▶ 300 m : GMTED2010
- ▶ 30 m : ASTER GDEM 2, SRTMGL1
- ▶ 1 m : Elevation1 - Airbus D&S

Satellite Imagery:

- ▶ 500 m : BlueMarble2
- ▶ 15 m : Landsat
- ▶ 50 cm : GeoEye, KOMPSAT, Pleiades, WorldView...

Manual adjustments:

- ▶ 0.9 cm : Custom scenery / fixes

Surface Scans:

- ▶ 0.25 mm : e.g. Quixel Megascans

## REAL-TIME FUSION

Geo-referenced image files:

- ▶ GeoTIFF, JPEG2000+WKT...
- ▶ Datum (e.g. WGS84/EGM96)
- ▶ Projection (e.g. Mercator)
- ▶ Parameters (e.g. origin, scale)

Myriad of possible combinations,  
huge amounts of data,  
cannot process in real-time!

Example: ASTER GDEM 2

<http://asterweb.jpl.nasa.gov/gdem.asp>

- ▶ Tiles á 3,601 x 3,601 pixels
- ▶ over 22,000 tiles
- ▶ more than  $2.8E+11$  pixels

Need uniform basis for geodata,  
to enable real-time processing!

## REAL-TIME FUSION

### Uniform base grid:

- ▶ Square
- ▶ Pixel-is-point:   $2^{n+1}$
- ▶ Pixel-is-area:   $2^n$
- ▶ Uniform datum: e.g. WGS84
- ▶ Sparse, i.e. per-pixel coverage
- ▶ Easy to scale (power of two)
- ▶ Easy to merge / combine

*Need to resample geodata to grid,  
must be done in pre-processing step,  
using a GIS processing tool.*

ArcGIS

GDAL

<http://www.gdal.org/>

Tinman 3D

<https://www.tinman3d.com/>

## REAL-TIME FUSION

### Uniform base grid:

- ▶ Need to choose a map projection,
- ▶ ...that works equally well
- ▶ ...everywhere on surface of Earth.

### To be used as a storage format:

- ▶ Lengths / angles are less important,
- ▶ ...heavy resampling at runtime.
- ▶ Areas must be preserved (almost),
- ▶ ...for high-quality sampling.

### Use 6 base grids instead of one, assemble as cubemap:

- ▶ Per-face projection (e.g. Gnomonic)
- ▶ Custom warp to improve GSD,
- ▶ ...for example:  

$$\sqrt{2x^2 + 0.5 * x}, \quad -1 \leq x \leq +1$$
- ▶ Works well for real-time processing.

Mercator?

Stereographic?

Cassini?

## REAL-TIME FUSION

Example uniform base grid:

- ▶ Grid size: 16 x 16
- ▶ Block size: 4 x 4

Data management:

- ▶ Per-block storage
- ▶ Lossless compression
- ▶ Random access

 Block #0 on level #0

 Block #1 on level #1

 Block #2 on level #1

 Block #3 on level #1

 Block #4 on level #2

...

 Block #15 on Level #3

Actual uniform base grid:  $2^{30}+1$

- ▶ 1,073,741,825 x 1,073,741,825
- ▶ Block size: 256 x 256

## REAL-TIME FUSION

[http://manual.tinman3d.com/Geodata\\_Examples.html](http://manual.tinman3d.com/Geodata_Examples.html)

### GMTED2010

- ▶ Whole dataset
- ▶ GSD : 274 m
- ▶ File size : 1.84 GB

### NED 1/3"

- ▶ Whole dataset
- ▶ GSD : 8.5 m
- ▶ File size : 31.8 GB

### ASTER GDEM 2

- ▶ Whole dataset
- ▶ GSD : 34 m
- ▶ File size : 116 GB

### NED 1/9"

- ▶ Whole dataset
- ▶ GSD : 4.2 m
- ▶ File size : 42.5 GB

### Landsat 7

- ▶ 2 selected scenes
- ▶ GSD : 17 m
- ▶ File size : 541 MB

### BlueMarble 2

- ▶ Whole dataset
- ▶ GSD : 548 m
- ▶ File size : 908 MB

## VISUALIZATION

A recipe for real-time 3D terrain:

### #1: Uniform base grid

- ▶ Simplifies scaling & merging
- ▶ Virtual storage, sparse data
- ▶ LOD-based partitioning

### #2: Continuous level-of-detail

- ▶ Choose relevant grid points
- ▶ Compute optimal triangulation

### #3: Incremental GPU streaming

- ▶ Exploit frame-to-frame coherence
- ▶ Only upload new data to GPU
- ▶ Reuse geometry batches (IB + VB)

Well-known recipe, but hard to cook:

Stateless, One-pass Adaptive Refinement (2002)

<https://computation.llnl.gov/casc/SOAR/>

Real-time Optimally Adapting Meshes (1997)

[http://www.cognigraph.com/ROAM\\_homepage/](http://www.cognigraph.com/ROAM_homepage/)

## REGULAR TRIANGULATION

## TRIANGULATED IRREGULAR NETWORK

## VISUALIZATION

GPU's are heavily optimized for geometric processing.

- ▶ Vertices
- ▶ Triangles
- ▶ Textures

Must be generate efficiently from geodata, according to current view.

- ▶ Visibility / LOD computation
- ▶ Generate terrain geometry
- ▶ Geodata streaming to GPU

Difficult to achieve in real-time!

- ▶ Pre-process terrain data
- ▶ Tolerate blurry textures
- ▶ Tolerate inaccurate meshes
- ▶ Tolerate defective meshes

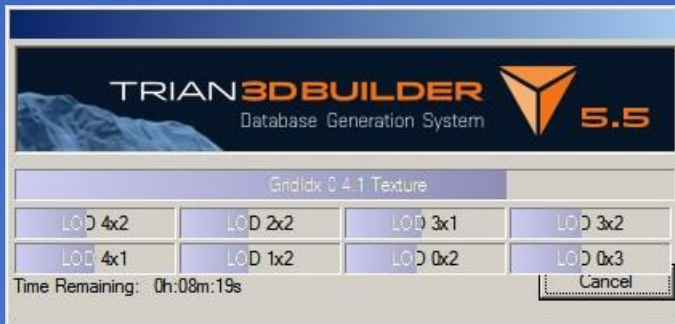

## DEFECTIVE TERRAIN MESH – GAPS AND T-JUNCTIONS

## VALID TERRAIN MESH – CLOSED SURFACE EVERYWHERE

## VISUALIZATION

*Pre-processing yields optimal results for selected region of interest:*

- ▶ *Valid terrain mesh*
- ▶ *Optimal triangle count*
- ▶ *High-quality textures*

*Generated terrain is static:*

- ▶ *Cannot edit after creation*
- ▶ *Difficult to merge / adjust*

Trian3DBuilder

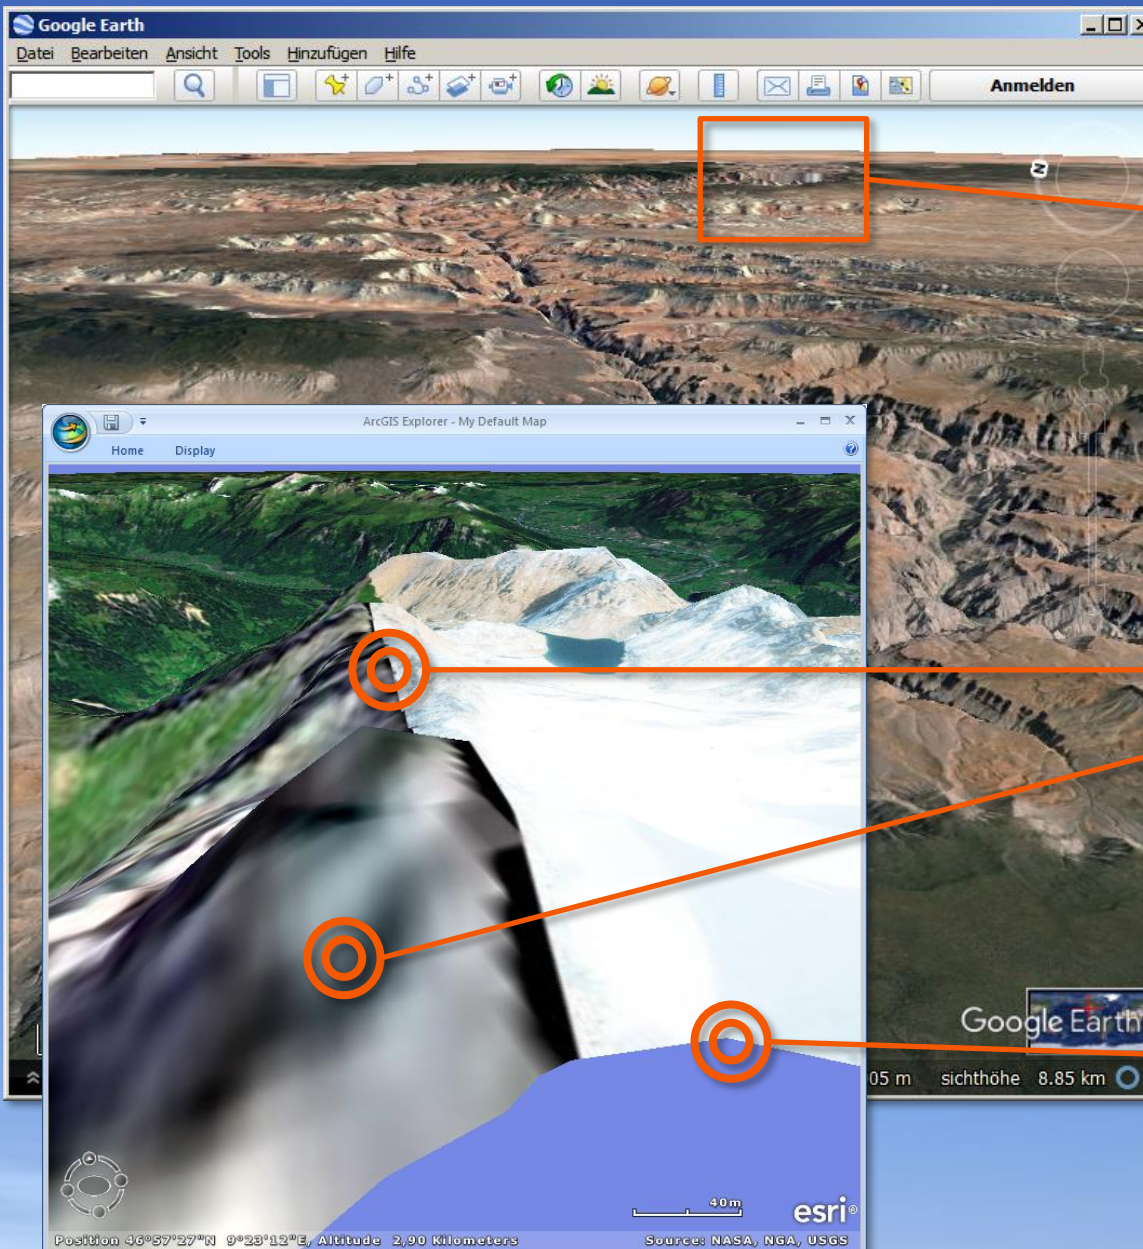

<http://www.triangraphics.de/>

Elevation1 by Airbus Defence & Space

<http://www.geo-airbusds.com/>

## VISUALIZATION

Performance vs. texture quality:

- ▶ Texture seams
- ▶ Blurry textures

Performance vs. vertices / triangles:

- ▶ Inaccurate geometry
- ▶ Fake geometry
- ▶ Low quality geometry

Challenging to implement a general-purpose 3D terrain solution!

<https://www.google.com/intl/de/earth/>

<http://www.esri.com/software/arcgis/explorer/>

## VISUALIZATION

**Continuous level-of-detail (CLOD):**

- ▶ Based on uniform grid
- ▶ Grid points → vertices 
- ▶ Grid cells → textures 
- ▶ Right isosceles triangles → RTIN
- ▶ Start with 2 triangles → root sector
- ▶ Split triangles at longest edge
- ▶ Fix T-junctions → forced split 
- ▶ Load new grid points only
- ▶ Merge leaf triangles

## Split & merge anywhere, any time:

- *Dynamic and adaptive mesh*
- *Terrain mesh is always valid*

## Uniform cubemap grid, size $2^{30}+1$ :

- ▶ Global coverage
- ▶ ~9 mm GSD for Earth

## VISUALIZATION

### Continuous level-of-detail (CLOD):

- ▶ Based on uniform grid
- ▶ Grid points → vertices
- ▶ Grid cells → textures
- ▶ Right isosceles triangles → RTIN
- ▶ Start with 2 triangles → root sector
- ▶ Split triangles at longest edge
- ▶ Fix T-junctions → forced split
- ▶ Load new grid points only
- ▶ Merge leaf triangles

### Split & merge anywhere, any time:

- ▶ Dynamic and adaptive mesh
- ▶ Terrain mesh is always valid

### Uniform cubemap grid, size $2^{30}+1$ :

- ▶ Global coverage
- ▶ ~9 mm GSD for Earth

## VISUALIZATION

### Spatial quad-tree data structure:

- ▶ Root sector spans whole grid
- ▶ Split recursively → 4 sub-sectors
- ▶ Can be inferred from CLOD,
- ▶ ... no extra work necessary!

### Attach textures to sectors:

- ▶ e.g. 256 x 256 texture per-sector,
- ▶ ... as done by GoogleMaps et al.
- ▶ to avoid texture seams,
- ▶ ... add blend weights to vertices:

$f$  : blend factor child → parent

$u, v$  : texture coordinates [0..1]

$B_0, B_1$  : precomputed coefficient vectors

$x$  : distance to point of view

$$f = \begin{pmatrix} 1 \\ u \\ v \\ u * v \end{pmatrix} * \left( \overrightarrow{B_0} * \frac{1}{x} + \overrightarrow{B_1} \right)$$

## VISUALIZATION

Spatial quad-tree data structure:

- ▶ Root sector spans whole grid
- ▶ Split recursively → 4 sub-sectors
- ▶ Can be inferred from CLOD,
- ▶ ... no extra work necessary!

Attach textures to sectors:

- ▶ e.g. 256 x 256 texture per-sector,
- ▶ ... as done by GoogleMaps et al.
- ▶ to avoid texture seams,
- ▶ ... add blend weights to vertices:

$f$  : blend factor child → parent

$u, v$  : texture coordinates [0..1]

$B_0, B_1$  : precomputed coefficient vectors

$x$  : distance to point of view

$$f = \begin{pmatrix} 1 \\ u \\ v \\ u * v \end{pmatrix} * \left( \overrightarrow{B_0} * \frac{1}{x} + \overrightarrow{B_1} \right)$$

## VISUALIZATION

*Augment with artificial detail:*

- ▶ *We have a smooth CLOD mesh,*
- ▶ *... based on accurate geodata*
- ▶ *... and / or authored content.*
- ▶ *Add per-vertex material weights,*
- ▶ *... to enhance visual output.*

*Augmented surface materials:*

<https://megascans.se/>

- ▶ *Obtained from real-world scans*
- ▶ *... at very high resolution: < 1 mm.*
- ▶ *Using standard PBR workflow*
- ▶ *... albedo / ambient occlusion*
- ▶ *... reflectivity / gloss*
- ▶ *... normal / displacement*

*Can be used to dramatically increase the  
perceived resolution of geodata.*

## VISUALIZATION

### Dynamic editing at runtime:

- ▶ We have a global uniform grid,
- ▶ ... at 9 mm GSD.
- ▶ Can add data anywhere,
- ▶ ... with arbitrary resolution.
- ▶ The CLOD mesh will adapt,
- ▶ ... so will the spatial quad-tree.

### Real-time editing workflow:

- ▶ Modify grids directly,
- ▶ ... or use separate grid for deltas.
- ▶ Correct bad data, e.g. spikes.
- ▶ Adjust inaccurate data, e.g. roads.
- ▶ Author custom scenery.
- ▶ WYSIWYG

Can provide editing facilities, without  
compromise or restrictions!

## ANALYSIS

*Need a spatial data structure,  
to perform queries efficiently:*

- ▶ *Collision test*
- ▶ *Visibility test*
- ▶ *Intersection test*
- ▶ *Signed distance field*
- ▶ *Nested data*

*CLOD mesh already has quad-tree:*

- ▶ *Attach per-vertex bounding spheres*
- ▶ *Attach per-vertex AABB's*
- ▶ *Add nested data to quad-tree,*
- ▶ *... bounding sphere radii*
- ▶ *... min / max elevation*
- ▶ *... material mask*

*Augmented quad-tree can be used for many  
kinds of spatial queries!*

*Thank you!*
